

I use this capacitor
symbol as a heating
element :)

The wires
might get
hot. How
to prevent
these
from
melting?

Which resistor to use here?

We do have larger resistors to cope
with higher currents.

Which resistor will hold?

External power supply
Pin bottom left = +12 VDC
Pin top left = GND
Check this!

The orange connection will
make the fan turn (upper pin
= PS_ON, lower pin = GND)
